

1. Ideation Phase

Project Title: Implement Client Script & UI Policy (Incident)

1. Problem Statement

Incident records often require consistent and accurate data entry to ensure effective triage, routing, and resolution. However, relying solely on user awareness and manual checks can lead to incomplete, inconsistent, or incorrect data being submitted. This impacts reporting accuracy, SLA compliance, and overall service quality. Enforcing conditional field behavior and validation directly at the user interface level is essential to ensure high data integrity.

2. Project Objectives

- Demonstrate ServiceNow client-side controls on Incident records.
- Dynamically enforce mandatory fields (e.g., Assignment Group) when Impact is High.
- Auto-populate field values (e.g., Urgency = High) via `onChange` Client Scripts.
- Prevent invalid record submission (when Assigned To is missing on High Impact incidents) via `onSubmit` Client Scripts.
- Block unauthorized list-view editing of the State field using `onCellEdit` Client Scripts.
- Ensure smooth reverse behavior when conditions change (Reverse if false = true).
